Simple Operator - Example 2:

BEFORE STARTING:

1) Install required tools: (Short link: **https://bit.ly/2FusHkf**)

2) Install Operator SDK (Short link: **https://bit.ly/2IDOZSI**)

For this first example of operator we provide a short and fast way to deploy it:

[LONG VERSION]: full steps to deploy the operator

[SHORT VERSION]: few lines and you will deploy the operator

[LONG VERSION]: full steps to deploy the operator

Create and deploy an app-operator using the SDK CLI:

```
$ minishift start

       "
       The server is accessible via web console at:
           https://192.168.64.2:8443

       You are logged in as:
           User:     developer
           Password: developer

       To login as administrator:
           oc login -u system:admin
        "

# (instead of "kubectl" you can also use "oc" command instead)
$ oc login -u system:admin
$ oc new-project myproject
$ oc project myproject

# Create an app-operator project that defines the App CR.
$ mkdir -p $GOPATH/src/github.com/example-inc/

# Create a new app-operator project
$ cd $GOPATH/src/github.com/example-inc/
$ export GO111MODULE=on
# Create a new Go-based Operator SDK project for the PodLimit:
$ operator-sdk  --verbose new podset-operator --type=go --skip-git-init
$ cd podset-operator

# Add a new API for the custom resource PodLimit
$ operator-sdk add api --api-version=cache.example.com/v1alpha1 --kind=Memcached

     INFO[0000] Generating api version cache.example.com/v1alpha1 for kind Memcached.
     INFO[0002] Created pkg/apis/cache/v1alpha1/memcached_types.go
     INFO[0002] Created pkg/apis/addtoscheme_cache_v1alpha1.go
     INFO[0002] Created pkg/apis/cache/v1alpha1/register.go
     INFO[0002] Created pkg/apis/cache/v1alpha1/doc.go
     INFO[0002] Created deploy/crds/cache_v1alpha1_memcached_cr.yaml
     INFO[0029] Created deploy/crds/cache_v1alpha1_memcached_crd.yaml
       …
       This will scaffold the PodLimit resource API under pkg/apis/app/v1alpha1/....

       The Operator-SDK automatically creates the following manifests for you under the /deploy
       directory.

       Custom Resource Definition
       Custom Resource
       Service Account
       Role
       RoleBinding
       Deployment
       Inspect the Custom Resource Definition manifest:
```

```
$ cat deploy/crds/cache_v1alpha1_memcached_crd.yaml
```

 # Modify the spec and status of the PodLimit **Custom Resource(CR) at** ../pkg/apis/cache/v1alpha1/memcached_types.go:

```
package v1alpha1

import (
    metav1 "k8s.io/apimachinery/pkg/apis/meta/v1"
)

// EDIT THIS FILE!  THIS IS SCAFFOLDING FOR YOU TO OWN!
// NOTE: json tags are required.  Any new fields you add must have json tags for the fields to be
serialized.

// MemcachedSpec defines the desired state of Memcached
// +k8s:openapi-gen=true
type MemcachedSpec struct {
    // Size is the size of the memcached deployment
    Size int32 `json:"size"`
}
    type MemcachedStatus struct {
    // Nodes are the names of the memcached pods
    Nodes []string `json:"nodes"`
}

// +k8s:deepcopy-gen:interfaces=k8s.io/apimachinery/pkg/runtime.Object

// Memcached is the Schema for the memcacheds API
// +k8s:openapi-gen=true
// +kubebuilder:subresource:status
type Memcached struct {
    metav1.TypeMeta   `json:",inline"`
    metav1.ObjectMeta `json:"metadata,omitempty"`

    Spec   MemcachedSpec   `json:"spec,omitempty"`
    Status MemcachedStatus `json:"status,omitempty"`
}

// +k8s:deepcopy-gen:interfaces=k8s.io/apimachinery/pkg/runtime.Object

// MemcachedList contains a list of Memcached
type MemcachedList struct {
    metav1.TypeMeta `json:",inline"`
    metav1.ListMeta `json:"metadata,omitempty"`
    Items           []Memcached `json:"items"`
}

func init() {
```

```
    SchemeBuilder.Register(&Memcached{}, &MemcachedList{})
}
```

 # After modifying the *_types.go **file always run the following command to update the generated code for that resource type:**

```
$ operator-sdk --verbose generate k8s
      INFO[0007] Code-generation complete.
```

 # We can also automatically update the CRD with OpenAPI v3 schema details based off the newly updated *_types.go**:**

```
$ operator-sdk --verbose generate openapi
      INFO[007] Code-generation complete.
```

 # Add a new Controller to the project that will watch and reconcile the PodSet resource:

```
$ operator-sdk add controller --api-version=cache.example.com/v1alpha1 --kind=Memcached
        This will scaffold a new Controller implementation under
        pkg/controller/memcached/memcached_controller.go
        $ cat pkg/controller/memcached/memcached_controller.go
```

 # Modify the PodSet controller logic at ../ *pkg/controller/*memcached/memcached*_controller.go*:
 # Link to the following file available at https://github.com/appuio/operator-sdk-examples/blob/master/memcached_controller.go

```
package memcached

import (
